220523 Valves

Design and Application Requirements
General
U-M Master Specification Section 22 0523 shall be used as the basis for valve specifications on projects, with the exception of valves for fire protection. This specification contains the minimum requirements for valves at U-M. Project specific requirements may dictate valves with additional features, higher pressure/temperature ratings, etc. The A/E shall therefore edit the U-M valve specification to make it project specific. While many valve service types are covered in the specification, not all are included. Add to the specification, service types not included, as required for the project. Turn on hidden text and read all spec. editor's notes when editing the specification.

Valves shall be specified with seats, stem seals and disc materials compatible for intended fluid, temperature, pressure and service. Valve pressure and temperature ratings shall be specified to meet or exceed those of the system in which they are installed.

Strainer blow-down valves shall be quarter turn ball valves.

Fire Protection
Valves for use in fire protection systems shall be FM approved.

Potable Water Systems
Valves in city water mains exterior to the building shall comply with City of Ann Arbor requirements.
